

# ***CIAM Flyer***

## **Annual Report 2013**

Until the CIAM bureau meeting December 2013 five issues of the printable PDF Flyers were produced.

- 1-2013      Flying in an Unbelievably Blue Winter Sky**  
For many years, model airplanes have been flown in wintertime on the frozen lake in Davos in the Swiss alps.
- 2-2013      Airshows – Sport with no Limits**  
It is often thought that aeromodelling only ever involves seconds, metres and performing geometrically precise aerobatics manoeuvres as accurately as possible. In our modern society, this limited perception of the term "sport" is no longer relevant.
- 3-2013      Electric jets – an interesting contradiction**  
Aeromodellers have long ago implemented a concept that is – at least to date – not possible in people-carrying aviation: faithful reproductions of jet aeroplanes with electric impeller propulsion (electric ducted fan, EDF)
- 4-2013      How aeromodelling can boost a career**  
The realisation that hobby and career can benefit each other is not new. Aeromodelling as a highly technical hobby and demanding sport presents a particularly large number of synergies with career and work. Many remarkable examples can be found in the technical trades and professions, one of which is CNC operator, Rogers.
- 5-2013      Fast Races with Electric Power**  
Electric Pylon Racing is a discipline involving some of the highest speeds in aeromodelling. These days, times of around 60 seconds for ten circuits around a triangular course of 400 m, corresponding to speeds of 300 km/h and more are not unusual.
- 6-2013      ???**

I kindly ask CIAM subcommittee chairmen for short “Stories” with good photographs in your relevant scene. I’m sure you will find good writers and photographers in every class. You will see, your work will bear fruits.

Thank you very much.

Emil Ch. Giezendanner
